

Scope of Work (DCS) – Document Review & Authentication Portal for BVG India

1. Objective

Develop a secure web application that enables BVG employees and approving authorities to upload, review, authenticate, categorize, approve, and share official documents. The system will maintain a controlled workflow and ensure traceability via auto-generated unique identifiers (UIDs).

Functional Scope

2.1 User Roles

1. **Employee (Maker)**
 2. **Approving Authority / Manager (Approver)**
 3. **Administrator** (for configuration, categories, user management)
-

2.2 Draft Document Upload Module (Maker)

- Maker will create the document offline in Word format and upload it in portal.
 - Maker must select a **Document Category** during upload (e.g., Customer Proposal, Regulatory Submission, etc.).
 - Maker must include the Project Code/Site Code on each submission
 - System will capture metadata:
 - Document title
 - Upload timestamp
 - Uploaded by (user ID)
 - Category
-

2.3 Review & Approval Workflow (Approver)

Approver can view the uploaded document in the portal and perform the following actions:

2.3.1 Reject Document

- Manager can reject the document and return it to the Maker.
- Rejection must include reviewer notes.
- Maker receives system notification (email + in-app).
- Maker makes the changes to draft and resubmits

2.3.2 Approve Document

- On approval, the document is finalized.
- A **system-generated UID** is permanently stamped/printed on the document.
- Date is automatically printed on the document
- Approved version becomes read-only and cannot be altered by any user.
- Then the process goes to step **2.4** (UID generation)

2.3.3 Change Document Category

- Approver can modify the category before approving.
- Then the process goes to step **2.4** (UID generation)

2.3.4 Edit Document Content

- Approver can modify the content before approving.
-

2.4 UID Generation & Stamping

- Each approved document will receive a unique UID.
 - UID will be embedded on the document:
 - Visibly Printed on PDF
 - Date is also automatically printed on the letter head
 - System must maintain:
 - UID
 - Timestamp
 - Approving authority
-

2.5 Document Sharing & Downloads

- Approved documents can then be:
 - Downloaded by maker and authorised users
 - Maker can print this document on Letterhead of BVG
 - Physical signature and/or Stamp taken on the approved copy
 - Maker then uploads the final approved copy which has sign/stamp on the portal.
 - System must maintain an audit log of:
 - Who downloaded
 - Who shared
 - When shared
-

2.6 Document Repository & Search

- Users (based on permissions) can view documents across categories.
- Features:
 - Category-wise browsing
 - Advanced search (by UID, title, Maker, date range, category, status)

- Filters (Approved, Rejected, Pending Review)
 - Admin can configure:
 - Categories
 - User roles and access permissions
-

2.7 Audit Trail

For compliance and traceability, the system will log:

- Uploads
- Rejections (with notes)
- Approvals
- Category changes
- UID assignment
- Downloads
- Email shares

Each log entry must include the timestamp, user ID, and action description.

3. Non-Functional Requirements (NFRs)

3.1 Security

- Role-based access control (RBAC)
- Encrypted document storage
- HTTPS for all data transmission
- Tamper-proof UID stamping
- Audit logs immutable

3.2 Performance

- Portal should support up to 100 concurrent users
- Document preview to load within 2 seconds for standard PDF size.

3.3 Scalability

- Architecture should allow scaling based on document volume and user growth.

3.4 Compatibility

- Web portal accessible via modern browsers (Chrome, Edge, Firefox).

3.5 Storage

- All documents stored in structured repository with lifecycle management
-

4. Out of Scope (for clarity)

- Document creation editor (documents are created offline)
- Integration with external HRMS, CRM, ERP (unless explicitly added later)
- Mobile application (web-responsive only unless separately scoped)
